

Although it is possible to use AutoCAD Cracked Version in many different ways, it is most commonly used for drafting. In other words, AutoCAD is used to draw diagrams, mark up blueprints, and so on. In addition, there are several specialty apps that include specialized drawing tools like piping and reinforcement, and there are also apps to do digital painting. If you've already bought a copy of AutoCAD and are learning how to use it, you're ready to learn about the menus and features. The first thing you'll notice when you open AutoCAD is that there are a lot of menus. Some are fairly obvious, like the menu that lets you select an object in your drawing. Others, like the Shape and Text menus, don't have much in common with the familiar menus on other Windows programs. If you know your way around Windows menus, you're not likely to have much trouble getting around the menus of AutoCAD. One of the more tricky things about AutoCAD is that it is designed so that a user can change the system defaults. Many programs give you a Start menu, for example. If you'd rather have your programs start with a bunch of recent folders, that's just the way it is.

AutoCAD gives you the same sort of options. There's a command-line option to change the system defaults. And if you've already custom-configured some features, you can also save and load custom settings from the user interface. The way that AutoCAD works is similar to that of most other Windows programs. The first step in getting familiar with AutoCAD is to open the AutoCAD app. If you're running AutoCAD on a Microsoft Windows PC, you'll probably find it in the Start menu. Click the AutoCAD icon on your Start menu, and you'll be taken to the AutoCAD app. If you're using AutoCAD on a Mac or Linux system, you can find the AutoCAD app in a list of installed programs. User-friendly dynamic links in the Link Assistant: Use dynamic links to quickly connect from one object to another with the press of a button. For example, a dynamic link can easily show you the dimensions of a rectangle in a larger room. (video: 5:25 min.) Creating dynamic links requires you to know the offset or pointer of the linked object. The new user interface in the Link Assistant now provides you with two methods to help you create more dynamic links: **Point/Offset** (requires AutoCAD 2016) – creates dynamic links that allow you to link a selected object to a different, nearby object. **Point/Actions** (requires AutoCAD 2019) – creates dynamic links that allow you to link a selected object to a different, nearby object.

To create a new AutoCAD Drawing Objects (Actions) action: Start the Action Type dialog box by choosing **Action – Edit**. Click the **New** button in the Actions section. Click the **Drawing Objects (Actions)** icon from the Action list to create an action that can be attached to multiple drawing objects.
