Note that there are a number of different Photoshop packages on the market. Photoshop CS and Photoshop Elements (both available at `www.adobe.com`) include a suite of editing features and tools. Photoshop Lightroom (see Chapter 17) is a simple, powerful tool for managing and editing large-image collections. Photoshop has many features for retouching images. If you've ever retouched a pic from your scanner, you've been doing Photoshop. Aside from cropping, adjusting brightness/contrast, and applying other color adjustments, you can also fix lens distortion, remove unwanted objects from an image,

clone images, adjust shadows and highlights, and add text and effects. You have a lot of control over your image and can produce amazing results. The following sections cover some of the basics of working in Photoshop, including the Photoshop workspace, layer management, basic tools, and the task bar and window controls. # THE PHOTOSHOP WORKSPACE When you first open Photoshop, it's just a plain and somewhat bland workspace. However, the interface does include a few important tools to help you get started. These tools enable you to create and manipulate layers, retouch images, and adjust colors, brightness, and contrast of images. You can create adjustment layers for much of the editing work you do; you can also use the adjustment layers as "underlays" that alter the look of any layer. Additionally, the top toolbar contains tools that come up automatically when you're working on a photo, such as the Levels window, the History (where you store your work) and keyboard shortcuts, and layers. On the right side of the workspace is the Photoshop Content panel. This panel contains a window for the type of image that you're editing, and controls for adjusting the overall color and tonal values. Also in the panel is an area that indicates that your image is too large to fit on your

monitor, and scroll bars along the bottom.

This article is about using free or open source tools to improve the quality of photos that you take with your mobile phone. It's not the only solution but it's a very good starting point. "Quality" is a very relative term, but today we're dealing with the quality of photo editing in the mobile photography section. The same methods can also be used for any photo editing, even professional ones. We're going to see how to edit photos using free or open-source tools, and then improve the quality of mobile photos. 1. Adjust brightness and color At first, let's focus on basic corrections to the brightness and color. After that, we'll look at filters. There's a good chance that your phone already has a camera that's pretty good. On the other hand, even if you use a dedicated camera, sometimes your photos aren't as good as they could be. Here are some tips to give you good results. Brightness The easiest way to adjust the brightness of a photo is to go to Image>Adjustment>Brightness/Contrast. Now, if you don't have a good camera in your phone, I don't really

recommend you edit the brightness in this way as you could lose some details. The first step is to increase the contrast a little. In the case of a photo of the street, which is often a very dull and grey image, you'll see that the difference between white and black is quite low. Now, if you want to have a photo that will look brighter in black and white, you have to start adding black. Go as far as you want to make your photo brighter. The white of the photo will begin to overlap the black. For some photos, black just won't help. You'll have to add even more black to make the image brighter. Now, in this case, there's a problem: it won't look nice. This is where you need to get closer or stand further away from the light. Until the white of the photo is pretty high, it doesn't really need to be as bright as the black. You only need to be very careful when you add black in the 05a79cecff

Asymmetrical division of the endosperm depends on the polarity of the plasma membrane of the presumptive daughter cell. There is growing evidence that changes in the structure and activity of the microtubules and cortical actin cortex play a role in the final division of the endosperm of many angiosperms. However, the molecular mechanisms underlying the breakdown of the cell plate and cleavage of the daughter cells, which are essential to the asymmetric division of the endosperm, are still poorly understood. Here we show that the breakdown of the plasma membrane is related to the polarity of the endosperm cells. Cryosections of ovules from the species Oryza sativa, Zea mays, and Pennisetum glaucum were fixed and labeled with biotin and fluorescent dyes before observation by confocal laser scanning microscopy. We found that the plasma membrane of presumptive daughter cells is polarized (one of the two sides is closer to the micropylar end) and that the breakdown of the cell plate at the apical end of the presumptive daughter cell is preceded by a microtubule-dependent loss of the cortical actin from the lower/apical half. Apical microtubules are not polarized

and they are short at the breakage point. The polar distribution of the cortical actin is also disorganized at the apical end of the presumptive daughter cell, but it is reorganized at the basal side of the cell. Knockdown of POLARIS, a large coiled-coil protein, known to be involved in the polar orientation of microtubules, affects the orientation and the breakdown of the cell plate and the asymmetric division of the endosperm in Arabidopsis thaliana. Moreover, at the micropylar/apical end of the presumptive daughter cell, many small fluorescent clusters of the exocyst component SEC3, known to be required for the polarized targeting of proteins to the plasma membrane, show an asymmetric distribution. These results provide new insights into the control of endosperm morphogenesis and suggest that the breakdown of the cell plate and the asymmetric division of the endosperm is connected to the polarized activity of the plasma membrane.Michigan is paying dearly to fix the damage caused by the Flint water crisis. Since 2015, the state has spent $919 million on infrastructure repairs, according to an NBC News analysis of state records and spending reports. That makes Flint the largest public works project in Michigan history

In this connection, as a flexible material, an aromatic polyamide such as nylon, polyethylene terephthalate, and poly butyramide and those containing them can be mentioned. These flexible materials are superior in mechanical properties, chemical properties, and electrical properties, and the like, and when they are molded as a thin film of general thickness of about 3 mm or less, they are widely used in a variety of fields such as fibers, films, and the like. They are superior as a semiconductor protecting film, a protecting film for a sensor, a protecting film for a fluorescent film, and the like, but when they are molded into a long film of 200 mm or more, they are poorly flexible and easily cracked. In order to improve flexibility of aromatic polyamides, an attempt has been made to blend a polyolefin with an aromatic polyamide and mold them together. However, since the aromatic polyamide is poor in compatibility with the polyolefin, in case that the molding temperature is high, not only crack defects are liable to occur but also the blending homogeneity is deteriorated. As a result, it has been difficult to obtain a composition having superior balance between the flexibility, processability, and mechanical properties. As the measure for

improving the compatibility and the blending homogeneity, a method in which a graft polymer is obtained by graft polymerizing a monomer such as styrene onto an aromatic polyamide has been proposed (Patent Document 1). However, in this case, an additional kneader is required in order to dissolve the aromatic polyamide in the monomer, so that the process is cumbersome and energy is wastefully consumed. As a method for obtaining a resin composition having superior processability and flexibility, a method in which a polyurethane is used for a polymer has been proposed (Patent Document 2). However, the resin composition obtained by this method is insufficient in mechanical properties and chemical properties, so that it is difficult to apply the composition to a substrate which requires high mechanical properties. Patent Document 3 proposes a resin composition obtained by adding, to a polyamide resin, a particular polyurethane compound in which an aromatic polyamide having a softening point of 180° C. or lower is used as the softening agent and a modified graft copolymer thereof. However, the resin composition is insufficient in flexibility, so that it is not necessarily superior in flexibility. Patent Document 4 proposes a resin composition obtained by adding, to a poly
