Clinical pharmacology of delafloxacin, a fluoroquinolone antibacterial. Delafloxacin is a new once-daily (OD) oral fluoroquinolone that is effective against serious Gram-positive and Gram-negative pathogens, including community-acquired and hospital-acquired pathogens. In three randomized, double-blind, multicenter trials in 559 patients, delafloxacin exhibited noninferior efficacy to levofloxacin and moxifloxacin, and was significantly more potent than moxifloxacin for eradicating methicillin-susceptible and methicillin-resistant *Staphylococcus aureus*. Delafloxacin was also noninferior to moxifloxacin and levofloxacin with respect to clinical cure of patients with community-acquired pneumonia (CAP), tested according to ERS and CAP RCT guidelines, and clinical cure or bacteriologic success of patients with acute bacterial exacerbations of chronic bronchitis (AECB). Delafloxacin was associated with fewer adverse events (including GI events) than comparators. It had a similar overall adverse event profile to moxifloxacin and levofloxacin, with the exception of an increased incidence of dizziness. Unlike other fluoroquinolones that require daily dosing, delafloxacin can be taken once-daily (OD). The results of three clinical trials demonstrate that delafloxacin is effective and well-tolerated in the treatment of CAP and AECB. The once-daily formulation of delafloxacin may improve patient adherence to therapy and is an attractive addition to the fluoroquinolone armamentarium. Alibaba.com offers 1,866 168 houses products.
