**Over the course of time more and more scientists discovered that the Earth is not the center of the solar system. Many far away planets are inhabited by intelligent life, where vegetables are the main food. To meet the demand for fresh food, a space transportation company has developed a new spaceship "Fruitpongel". But the ship is far from ready and on the way a lot of things can go wrong. Therefore the developers decided to test the ship before its launch. The players have the mission to assemble the incomplete spaceship, collect all equipment, repair, maintain and ship the ship on the way. The players take on the role of individual workers and will also collect the standard equipment like x-ray machines, surgical tools, autoclaves and stabilisers. They will also be able to take a stab at the equipment and use it to save the fruitpongels. Features:**

- **Become the leader of a team of workers on a remote space station in the year 2050.**
- **Grow and maintain the outer space station.**
- **Manage and repair the spaceship Fruitpongel.**
- **Become the captain of the**

## **What's new:**

**ultaneous Connections Description: The objective of this guide is to provide best security practices for VirtualBox users when it comes to keeping their VM's secure. The focus of this guide is not to attempt to educate VBox users as to how to secure their VM's, but to raise awareness to the problem and illustrate the importance of not becoming a victim of it. The problem is quite serious, in that it can occur with just a little bit of configuration, and if left unsecured, it can give a host system the ability to communicate with multiple services, and be accessed from the Internet. In fact, this can happen even if the host is on your local subnet and behind your ISP's NAT, so we strongly recommend secure firewalling on your entire network, if that does not already exist. The biggest risk, of course, is if you are running VirtualBox on a host that has not already been compromised. The risk of the host being compromised is not discussed here, because the guide would no longer be effective in that case. In such cases, it is advisable to not install VirtualBox at all. If you insist on trying to use it, you will have to secure both VMs and the host. The steps to secure a host are discussed in sections 2 through 7 below, while VM's security is discussed in section 8. If you are VBox-aware, the sections below attempt to raise awareness of why securing all communication is so important. If you are not yet aware of the problem, please take a look at the reference site.**

**1. Definitions**  
A host is any machine that can run VirtualBox. A guest is a VBox VM.

**2. Which Services Should I Secure**  
What services should I secure? By securing VirtualBox VMs, and securing VirtualBox services that are running on the host, you will do more to secure the system as a whole, than if you only secure individual VMs. The KungFu doll analogy is useful here. If you try to secure only one head, then you have to cut off a limb to do it. If you secure all the heads, you need not cut off a limb.

**"People get fooled all the time because of a collective failure to think".--Timmy Horstmann**
