7000nmQ: How many data points can a single person have?
This question came up when I was showing a visitor some stats. My normal responses to this kind of question are: as many as you want, for whatever reason you may have we're not here to judge But I don't know what the math here would be. Let's say the average person does something on average once every 30 days. Let's say we had a thousand people with an average of 1 new activity per 30 days. How many data points (by my definition above) would the average person have? A: Even if there were no "average person" there is no reason to assume that any given individual would have less than 15 data points. There is no magic number or process by which one may conclude that 15 is appropriate or not. A: If you define "activity" as "task that starts a process or does something", then yes, you can have thousands of activities. You can have a golf score of 1300 if you pull the trigger with each club swing and a hole in one on the 18th; you can only have 1000 if you just stand there. You can have thousands of activities without turning your hands into bottlenecks for the transmission of your thought/action impulses. So the number of activities is unlimited, but the number of data points is finite. If you don't measure something you can't really know how much you've done, so your number of data points is constrained. Q: What are these sheaves for? I was studying a book on algebraic geometry written by Camille Jordan when I stumbled upon these sheaves $\mathcal{O}_{\mathbb{P}^n}(r)$ which I've never encountered before. What are they for? They seem to play some role in the proof of the Chevalley-Shephard-Todd Theorem, but I can't see it right now. A: The sheaves you mention in the title are the dual of the degree n homogeneous pieces of $\mathcal{O}_{\mathbb{P}^n}(r)$ (with $\mathcal{O}_{\mathbb{P}^n}$ being the structure sheaf of \mathbb{P}^n). For the proof of your theorem you might want to look at this. In
