What's New in the DigSig?

VirusTotal Description: DigSig is a simple-to-use utility designed to show the digital signature of a file (using Microsoft's security token) to determine the validity of the signature. DigSig doesn't even require an administrator privilege; the user who runs the program will simply be asked to verify the digital signature of a file. DigSig is designed to verify digital signatures created by WinTrust.DLL. This is Microsoft's trusted digital certification system. DigSig will check the digital signature of a file in the Windows directory, its subdirectories, and all files in the specified folder. You'll be shown the name, version, and publisher of the file being tested along with the total number of signatures that were successfully validated. You can show the results to the user or store them in a text file. DigSig Features: No installation is required. Provides options through command-line interface only. Checks the digital

signature of one or more files (by default all files in the current working directory and its subdirectories). Will check the validity of digital signatures for trusted publishers. Will show the publisher information in the file's properties page: company name, company name abbreviation, company URL, and legal name. Will show the signature verifier details when you scan a file with DigSig. When running the utility, you can choose to list only the valid signatures, to list only the total valid signatures, or to list both of them. Customizable report layout. It is recommended to press the list button to view the selected signatures. "Set-up" mode for specifying the input and output file location and name for future scans. Built-in help system. You can view the help by typing:? Other features: To examine whether WinTrust.DLL is present on the local PC, check the contents of C:\Windows\Installer. If the file is missing, it means that WinTrust.DLL cannot be found and it cannot be verified. If it is present, you'll be provided information about which certificates were used to create the signature for WinTrust.DLL. Note: To do so, simply type the desired file path (for example, C:\Windows\Installer\WinTrust.DLL) in the text box. When the input file is a folder,
