However, in 2020, they released Photoshop for Mac instead of Elements. Edit images. Photoshop is a powerful picture

editor for professional graphic designers, artists, illustrators and photographers. Its robust feature set, many filters and tools and convenient shortcuts can be used to change the look of a picture.

The following sections will introduce you to the tools, filters, and effects of Photoshop, and highlight some of the most popular and useful features.

Pencil tool. If you press the shortcut keys, Photoshop will outline or select an object and

move it to the corner of the screen, making it easy to select the object. However, you can also use the Pen tool on the tool bar. You can use the Pen tool to draw shapes and lines by clicking the mouse and drawing. You can also use it to edit or delete objects by clicking on them. The Pen tool helps you to create professional-level graphics, make reproductions and drawings in a variety of formats, and make illustrations, which are

supported by most graphic design programs. Image analysis. A powerful image analysis tool is the Lasso tool, which is designed to select objects such as circles, ovals, squares, rectangles, and polygons. Photoshop makes it easy to select objects with the Lasso tool. The Lasso tool can be used to select most objects or parts of an image such as a leaf or the clouds in the sky. By pressing the shift key and the click button, you can convert the

Lasso tool to a polygon or rectangular selection. The Lasso tool makes it easy to adjust the size, shape and color of these selections. Create new text. You can create new text by opening the text tool (See below) on the tool bar and then enter text to make it. You can enter text in English, French, Japanese, Chinese, and other languages. The text tool is very useful for text editing, especially if you do not know English. It can be used

to create international business presentations, display text on web pages, create slide decks, and create emails. You can edit the font settings by using the menu bar. Adjust the image. The ruler icon can show you the size of the selected areas, as shown in Figure 1, or you can use the menu in the tool bar to adjust the scale of the document. For example, you can drag the document and move it

Q: Return JSON from a function in Flask Python I need to return JSON from a function in Flask which will then be stored in Flask body. Although when I return jsonify it works, but I have to define the function before I jsonify.

```
@app.route("/hello") def hello():  
return jsonify({'data': 'Hello  
World'}) @app.route("/hello2")  
def hello2(): return
```

```
 jsonify({'data': 'Hello World2' })  
 ... @app.route("/hello2/") def  
 hello2(): return jsonify(hello2())  
 @app.route("/hello2") def  
 hello2(): return jsonify(hello2())
```

Question: I need to define the function `hello2()` in Flask route before calling `jsonify`. Is this

possible? How can I do it? A:

You can use a normal function, take advantage of the way flask supports route parameters (using the special variable `_request`).

```
def hello2(request): #
```

request.jsonify() does the JSON encoding for you return {"data": "Hello World2" }

```
@app.route("/hello2/") def  
hello2(request): return
```

```
jsonify(hello2(request))
```

Q: Solr multiple fields query filter I have a project in which I want to make a search function. I've successfully made it with the help of an example in solr documentation. Now I want to make it with 2 or more fields. an input box for searching by a

person's id an input box for
searching by place's id public

```
static SolrClient getSolrClient() {  
    SolrClient solrClient = null; final  
    SolrQueryRequest request = new  
    SolrQueryRequest("solr");  
    request.addFilterQuery("id",  
    "simple query by person id");  
    request.addFilterQuery("id2",  
    "another one"); try { solrClient =  
    getSolrClient("");
```

artistsQ: how to prevent mysql to
auto generate primary key I am
developing a PHP web app using
MySQL db engine. I want to
prevent MySQL to auto generate
primary key but still I want to
auto increment the column's
value whenever I insert a new

data into the db table. I tried to alter table's column using command `ALTER TABLE CHANGE column_name column_name BIGINT NOT NULL AUTO_INCREMENT;` But, this automatically generate primary key and auto increment column value as NULL. Is there any other command to stop MySQL from auto generate primary key and auto increment column value as NULL? A: `ALTER TABLE `table``

```
CHANGE `column_name`  
`column_name` BIGINT NOT  
NULL AUTO_INCREMENT;
```

And make sure you don't forget the (!) after NOT

Q: How to speed up a function with 100,000,000 iterations

I have a function that takes in an array of numbers, applies a series of operations to it, and returns an array of results. I need to run this function 100,000,000 times and compare it to a second function that only takes numbers from a

different array and returns those numbers. I'm guessing that because I have to iterate 100,000,000 times that the execution time of my program is going
