Photoshop's odd name, which you hear in the back of some people's minds when they talk about it, comes from its place of birth. The program's creators decided to name it after the effects it could achieve rather than after its home studio. Blending Hue and Saturation Blending hues and saturation is a simple, yet powerful, way to change the look of an image. You can use it to add a little more color, make an image more playful, or create an illusion of a special effect. When you have two colors — in this case, a neutral gray (shown in Figure 5-4) and a bright red (shown in the top image of the figure) — your eye's perception of the color is affected by brightness, clarity, and contrast. Changing the hue and saturation at the same time is a simple way to change the colors in an image, making it appear more vibrant and alive. **Figure 5-4:** Painting on the image using different hues and saturation options. To change the appearance of an image, go to the Image⇒Adjustments⇒Hue/Saturation menu. Choose a color from the color palette and drag it onto the image. Figure 5-5 shows an example of this process. **Figure 5-5:** Change the hue and saturation of the image by choosing a color and dragging it over the image. If you use Photoshop for painting on your images, you can make paintovers easily — that is, make pixels transparent. Just open the image and paint on the layer that's showing. As you paint, the paintover blends with the previous image layer's color. Blend mode: Normal, Multiply, and Screen After you paint or draw on your image, its layer can be chosen with the Select tool. In addition to this tool, you have several tools to change the appearance and color of an image. The blending modes are color adjustments you can use to change the look of an image. In Photoshop, you can

good body figure in her high school days!" "Well, it was just her mother's view, I mean, you know, that was not her mother's objective. But I was deeply in love with her and I still am, you know, so I just accept her as she is, I mean, just her body figure." "Do you still keep in touch with her mother?" "Not much. Well, not now. When I was still there in San Francisco, I called her up and she came up to visit me. It was the first time for almost three years I'd seen her in person, and we were all happy seeing her, you know, in person, I mean. It was really something, in fact. It was like Christmas time. But then, she also never wanted me to call her after that, but I would go to see her whenever I can go. I was married to a woman here, so I would go see her every once in a while when I was in the states. I was married to a woman in the US, so I took holidays during the off-seasons, so I wouldn't end up missing my yearly vacations. It was always something." "Who was she?" "I didn't know her. She was just a woman, you know. She was so bright as a child, a really bright student. We became friends, that's all." "Did she visit you frequently in the states?" "Well, yes, I mean, yes, she did, once in a while. Not often." So, is it that this kid seems to have a quite long history in this country, we asked? "I don't think so. I don't think so. Well, not at all. I don't think so. But, maybe I did for a few years, I mean, I don't know. I didn't leave the US often. I mean, I would take my holiday every year, but I always went back to see her whenever I could go back there. She was never in the habit of coming to visit me. And I always had my yearly holidays in San Francisco or I'd go to visit her or something like that." "Is she still living in the States?" "

Characteristics of CD45RA+ T cells in early HIV infection. The development of HIV-specific cellular immune responses is determined by many factors. In the present study we have analyzed the CD45RA+ and CD45RA- subsets of CD4 T cells in 5 untreated HIV+ homosexual men who recently became infected with HIV, 5 homosexual men who have been seronegative, 5 HIV-infected hemophiliacs, 5 HIV-seronegative hemophiliacs, and 9 normal healthy subjects. We found that the proportions of CD45RA+ cells did not correlate with age, but that the rates of CD45RA+ cells were significantly lower in HIV+ homosexual men than in the HIV-seronegative subjects. Although the rate of CD45RA+ cells was significantly lower in the HIV-infected hemophiliacs than in the HIV-infected patients with asymptomatic HIV infection, the CD45RA+ cell population did not appear to be further altered by the use of anti-retroviral therapy. These data demonstrate that HIV infection in a population of homosexual men causes quantitative changes in the normal CD45RA+ T cell subset distribution and also significantly alters the patterns of specific HIV-induced T cell responses.Q: Is it safe to use list comprehensions when defining function / method parameters? is it safe to use list comprehensions when declaring function / method parameters? Suppose I define a function which must use the same list 3 times: def f(i): return [i for i in list1 for j in list2 for k in list3] or def g(i): return [i for i in list1 for j in list2 for k in list3] Or in the special case of a generator: def h(i): return (i for i in list1 for j in list2 for k in list3) or def h(i): return list(i for i in list1 for j in list2 for k in list3) It seems that all these definitions work when called as f(i), g(i), h(i) but would break if I use the following syntax: f(i) g(i) h(i) Would it be ok to use this syntax only for short calls? Is it
